

ASPWIFI S.L.

Best Internet Operator 2016 - Catalonia

Aspwifi is dedicated to supporting those in remote areas, providing them with connectivity and maintenance services. We invited Manuel Hernández López to talk us through how the firm supports these communities.

Aspwifi is based in Catalonia, where our core business focuses on areas withdrawn from the cities, where Internet connections are poor or non-existent. As such our core aim is to reduce the digital divide, which is getting bigger due to fibre optic connections, which are being deployed in large cities and not to small towns or rural villages.

Our service offering encompasses internet, telephone and TV. We are also the only operator of radio stations from Spain which offers quad play, and speed connections from 30Mb to 500Mb residential user.

The firm is highly successful, and as such we have the support of the leading manufacturers of wireless devices, who choose our company to test their latest devices, and we offer them feedback on their performance to help them improve their product. Aspwifi are Beta Tester of many manufacturers, and as a result we are able to implement the very latest technology in our network equipment, even before it is available for sale.

This investment in technology is vital to ensuring that our clients receive the very best service, as is security, which is vital to ensuring clients have a secure internet connection which they can use for activities such as online shopping or checking email accounts. By being security conscious and up to date with the latest technology we are able to ensure that we are also ahead of any new legislation or regulation.

Ultimately the firm is dedicated to providing products and services which are at a high standard, as this helps us to generate loyal customers and ensures the continued success of the business over the years to come.
